

# What Are Minerals

## MINERALS

Minerals are naturally occurring substances which have a crystalline structure. Other export earners such as agriculture rely on minerals to survive. All minerals have a chemical formula, and are classified according to their chemistry. Luckily the most common 30 minerals account for nearly all of the earth's crust. Minerals are defined as solid, inorganic, naturally occurring substances with a definite chemical formula and general structure. Almost all chemical elements in the Earth's crust are associated with at least one mineral. Some are uncombined elements, such as gold, silver, sulfur, bismuth, copper and platinum. Minerals are solid substances that are present in nature and can be made of one element or more elements combined together (chemical compounds). A mineral is a naturally occurring chemical compound, usually of crystalline form and not produced by life processes. A mineral has one specific chemical composition, whereas a rock can be an aggregate of different minerals or mineraloids. Minerals are distinguished by various chemical and physical properties. Definition - Chemistry - Physical properties - Classification. A mineral is an element or chemical compound that is normally crystalline and that has been formed as a result of geological processes. 29 May - 3 min - Uploaded by Whats Up Dude In this video I discuss what are minerals, what do minerals do in the body, as well as minerals. What are minerals? Minerals, like vitamins, play an essential role in the maintenance of your body's metabolic functions and growth. You use objects that are made from minerals every day, even if you do not realize it. You are actually eating a mineral when you eat food that contains salt. In this lesson, you will learn about minerals and their properties. You will also understand the importance and everyday use of different types of minerals. The Building Blocks of Crust. If you were planning to bake a pie, what ingredients would you use for the crust? The ingredients used to make the crust are all around us, but they have unique properties which make them useful to humans. Their unique properties are what separate them from other types. Minerals are naturally occurring, inorganic solids with a definite chemical composition and a regular atomic structure. From this basis come all. What are minerals? They meet four criteria, but there are some exceptions to the rules that we explore in this article. These pages are designed for the nonspecialist with an interest in minerals. Just like vitamins, minerals help your body grow, develop, and stay healthy. Find out more about minerals in this article for kids. Vitamins and minerals are nutrients that the body needs to work properly. They boost the immune system, promote normal growth and development, and help. Minerals are solid, naturally occurring inorganic substances that can be found in the earth's crust. They are formed without the intervention of humans and have. For instance graphite has the lowest hardness of minerals, and diamonds are the hardest. In other words, all other minerals will scratch graphite; no other. Learning outcomes: Define mineral resources. Define a mineral. Give examples of mineral resources and products that contain them. List the.
